

Tracing the evolution of non-typhoidal Salmonella: Is a new superbug emerging?

Presented by

Oliver Cliff

Complex Systems Research Group

THE UNIVERSITY OF
SYDNEY

Why salmonella in NSW?

- › **93.8 million cases** and **155,000 deaths** each year globally
 - More cases in Australia than anywhere else
 - Most fatal airborne disease in Australia

 - › **S. Typhimurium (STM)** is the dominant subspecies of non-typhoidal salmonellosis

 - › Drivers of their evolution remain poorly understood
-

- › Nine consecutive seasons of instances in NSW
 - 1st January 2008 to 31st December 2016

- › **17,107 isolates** of STM
 - 99.3% of all STM found from human cases in NSW over 3,287 days

- › Genotyped through **MLVA**
 - MLVA = **M**ultiple-**L**ocus **V**ariable-number tandem repeat (VNTR) **A**alysis
 - Allows for more diversity of strains to be identified
 - 1675 unique MLVAs identified

Tandem repeats

› MLVA profile and fragment sizes

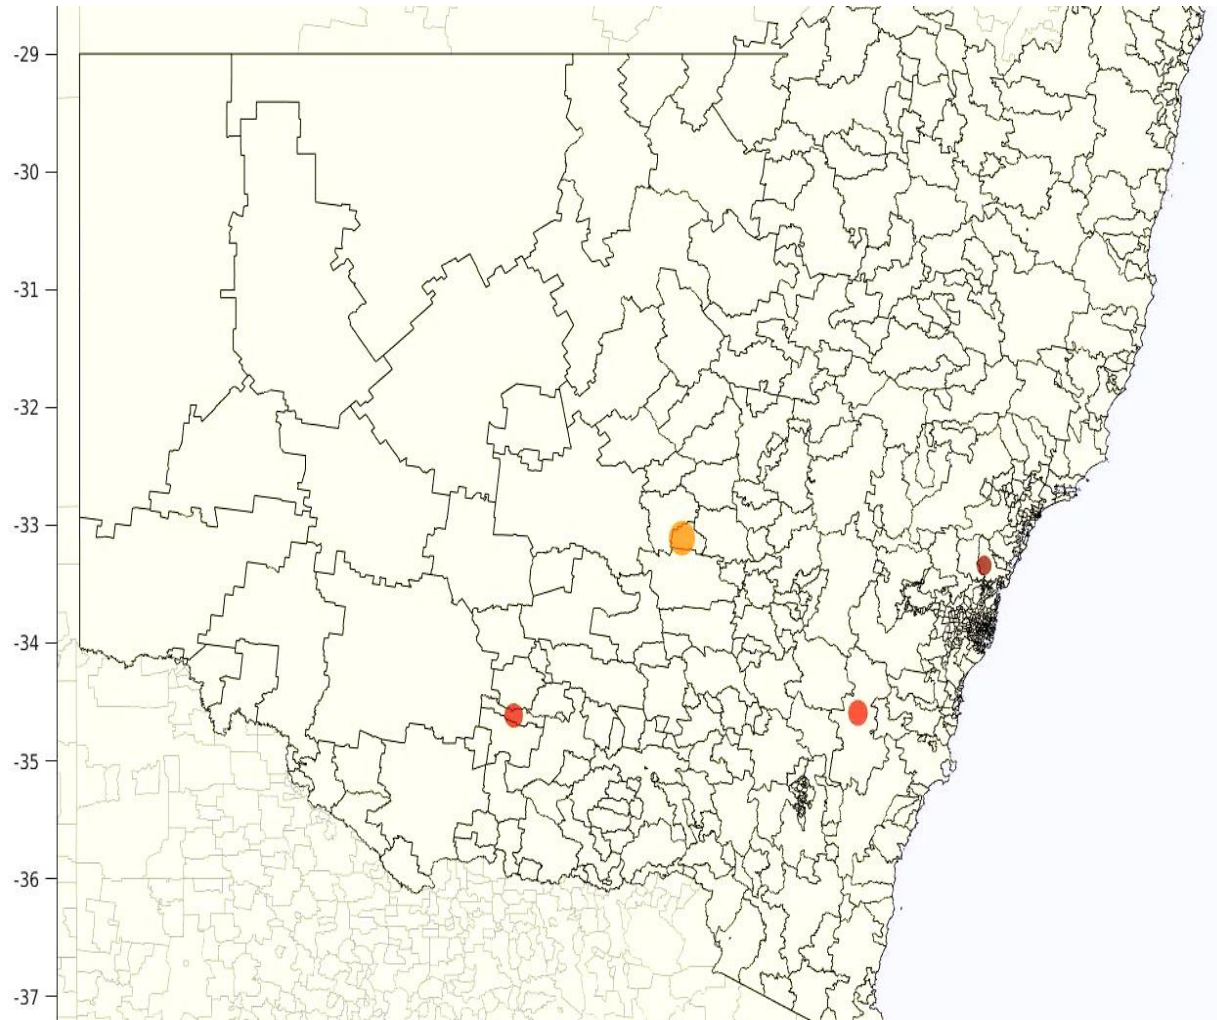

› MLVA profile and fragment sizes

› MLVA profile and fragment sizes

Dataset: STM in NSW 2008-2016

MLVA isolates as a complex network

- › Considered as a complete graph
 - 1675 nodes (unique isolates)
 - Edge weights are inverse of pairwise MLVA distance
- › Get closeness centrality of MLVA isolate in network
- › Cluster isolates
 - **Partition** (linkage) clusters
 - **Overlapping** clusters
- › Study evolution (incidence) of global network and individual clusters

› Edge weights

- Inverse of Manhattan distance (L1-norm)

x 3 9 8 9 2 12

› Edge weights

- Inverse of Manhattan distance (L1-norm)

<i>x</i>	3	9	8	9	2	12
<i>y</i>	3	10	8	8	2	12

› Edge weights

- Inverse of Manhattan distance (L1-norm)

x	3	9	8	9	2	12
y	3	10	8	8	2	12
$d(x, y)$	0	$ +1 $	0	$ -1 $	0	0

› Edge weights

- Inverse of Manhattan distance (L1-norm)

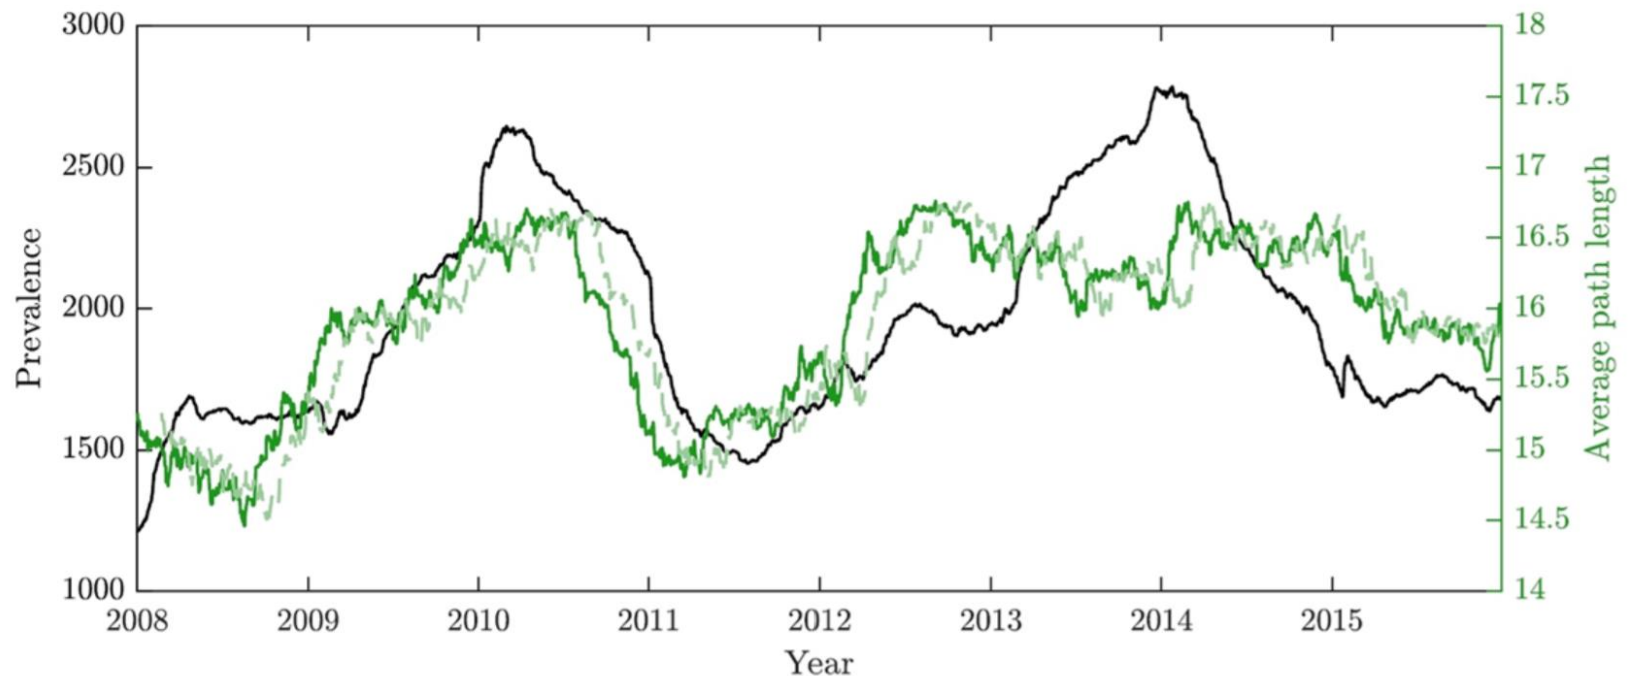

x	3	9	8	9	2	12
y	3	10	8	8	2	12
$d(x, y)$	0	$ +1 $	0	$ -1 $	0	0

› Closeness centrality $c(x) = \frac{1}{\sum_y d(x, y)}$

Closeness centrality of MLVA profiles

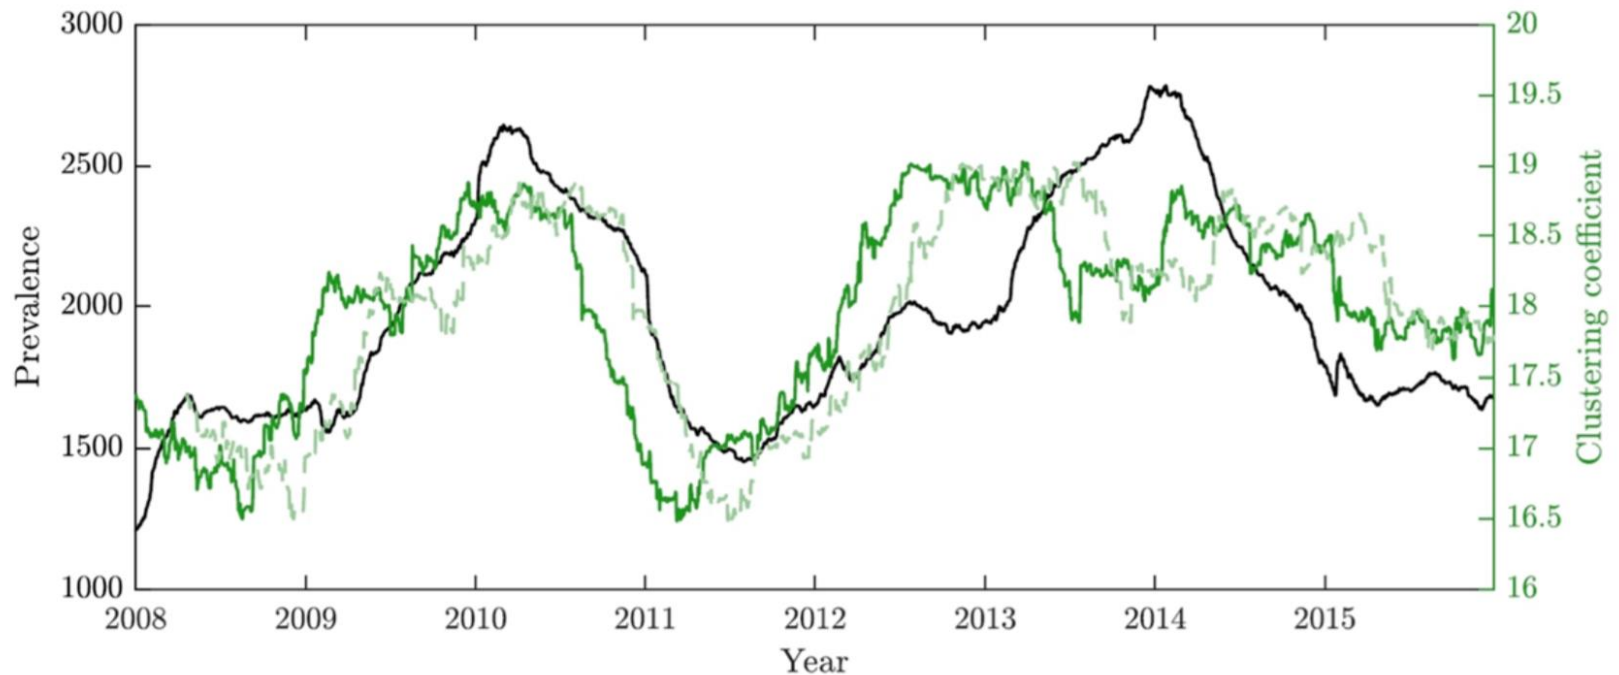

Path length and prevalence ($\rho \approx 0.7$ at ~ 100 days)

- › Path length: average distance to all other nodes

Clustering coefficient and prevalence ($\rho \approx 0.7$ at ~ 50 days)

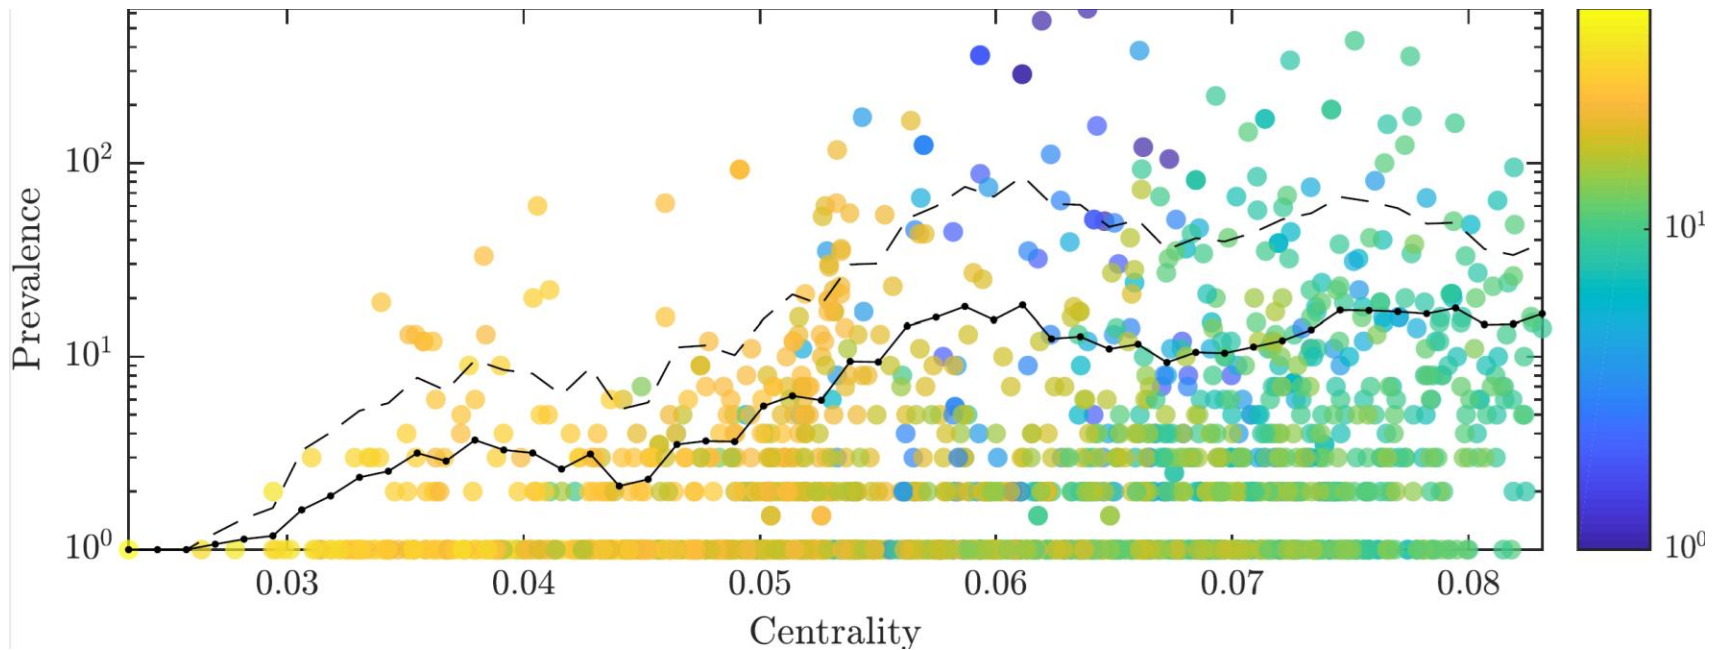

- › Clustering coefficient: how close a node is to being a clique (complete graph)

Small world coefficient and prevalence ($\rho \approx 0.6$ at ~ 300 days)

› Small world coefficient: ratio of clustering to path length

Closeness centrality of MLVA profiles

- › Black line traces binned averages
- › Colours denote distance to most prevalent node
- › Higher centrality correlates to higher prevalence

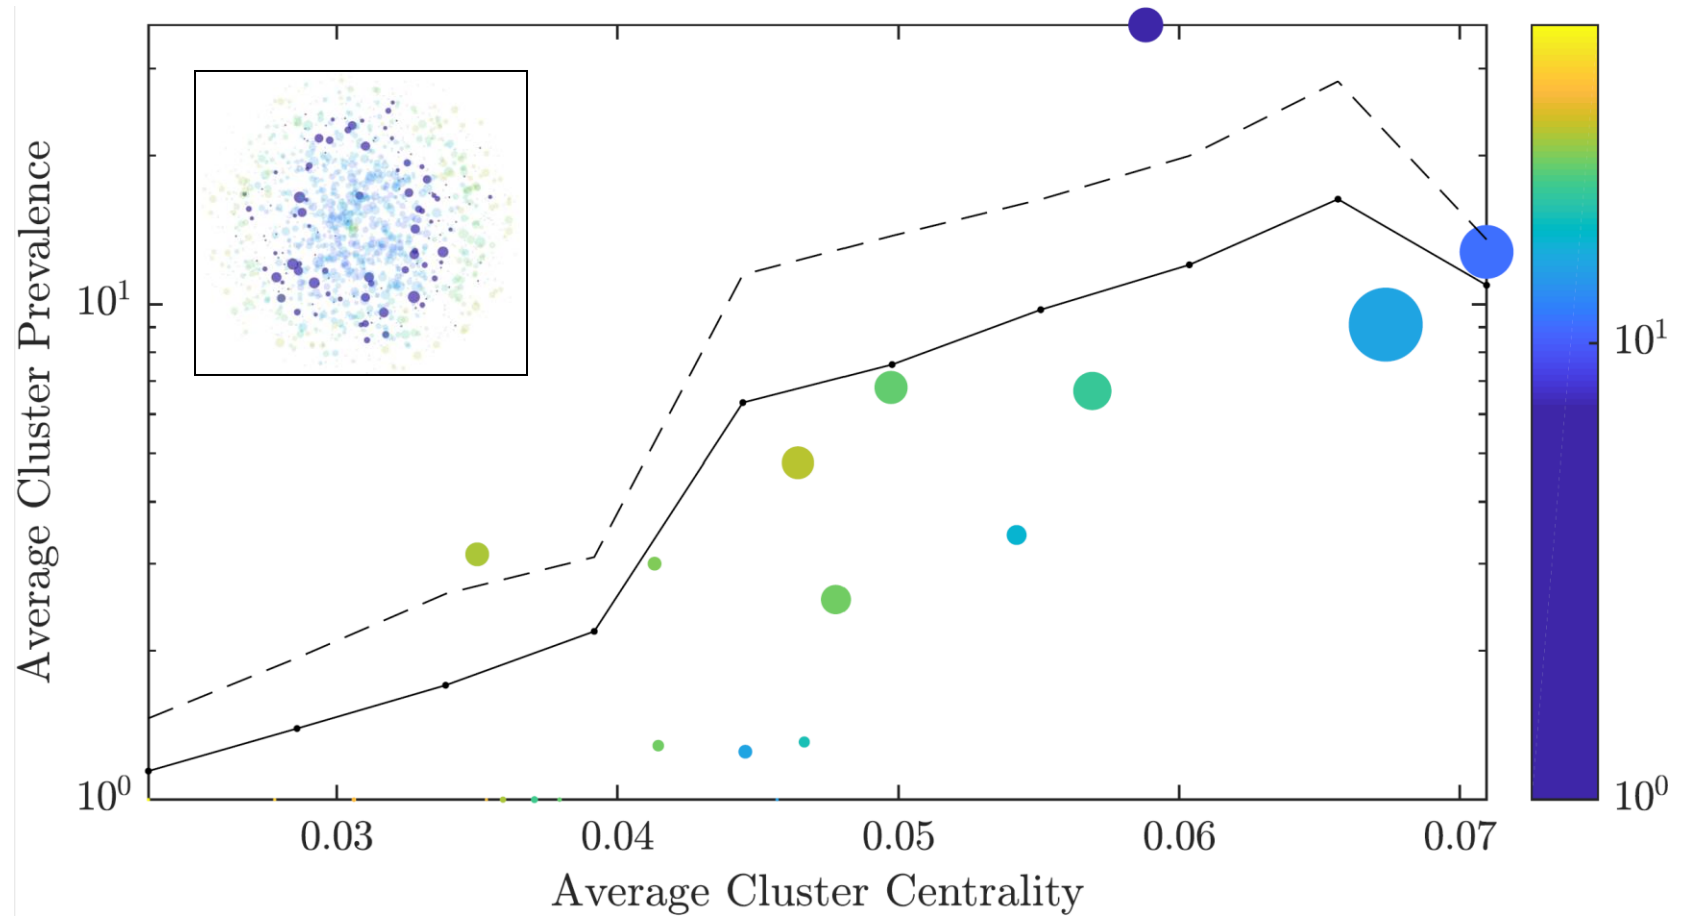

Linkage (partitioning) approach

Overlapping approach

Incidence-Centrality plot (partitioning clusters)

Incidence-Centrality plot (overlapping clusters)
